FORTRAN Syntactic Analysis Specification

W. M. Waite

November 3, 2006

Abstract

This document defines the grammars used by X3.9-1978 (FORTRAN 77) and ISO/IEC 1539 (FORTRAN 90). It is a part of an Eli specification from which scanner/parsers for FORTRAN 77 and FORTRAN 90 can be generated. Generation of the parser is controlled by a FunnelWeb macro. The following selects the code for FORTRAN 77 analysis (`0` selects the code for FORTRAN 90 analysis):

Fortran77[1] ≡
1This macro is invoked in definitions 19 and 21.

Some symbols of the FORTRAN 77 grammar have been changed to their FORTRAN 90 counterparts, and changes necessary to remove ambiguity have been made. Cross references to both the FORTRAN 77 and FORTRAN 90 standards are included.

Additional rules specific to FORTRAN 90 can be found in a separate document.

This specification was created originally in January of 1987 by W. M. Waite and J. Hoffmann. Further development in the fall of 1989 by R. Jakob made it a basis for an analyzer for the "Force" extension of FORTRAN. Both of these versions only handled "nice looking" FORTRAN programs, because of weakness in the lexical analyzer. These restrictions were removed in the summer of 1993 by W. M. Waite, while he was a visiting researcher at the GMD in Berlin.

Contents

1 Context-Free Grammar

The grammar is structured according to Appendix F of X3.9-1978, and contains references to the rule numbers in ISO/IEC 1539. Cases in which strict adherence to Appendix F of X3.9-1978 would have either resulted in LALR(1) conflicts or compromised later semantic analysis are explained in subsequent sections. The rules for those cases are replaced here by macro calls giving the name of the section in which the change is explained.

1.2 Productions Specific to FORTRAN 90

The grammar is structured according to ISO/IEC 1539. It only gives those rules that are specific to FORTRAN 90, and contains references to the rule numbers in Appendix F of X3.9-1978 for rules that are common to FORTRAN 77 and FORTRAN 90. Cases in which strict adherence to ISO/IEC 1539 would have either resulted in LALR(1) conflicts or compromised later semantic analysis are explained in subsequent sections. The rules for those cases are replaced here by macro calls giving the name of the section in which the change is explained.

2 Changes Due to LALR(1) Conflicts

2.1 Entry Statement

Entry Statement[4] ≡

```
xEntryStmt:
  xLblDef 'entry' xEntryName xSubroutineParList xEOS .
```

This macro is invoked in definition 2.

2.2 Specification Expression

Specification Expression[5] ≡
xExprThis macro is invoked in definition 2.

2.3 xTypeParamValue

FORTRAN 90 rule `R507` permits a `xLengthSelector` to be a `xTypeParamValue`. Most of the variants of `xTypeParamValue` are already allowed in this context by other rulles, so simply using the symbol `xTypeParamValue` leads to conflicts. The suolution is to add a rule allowing the only variant of `xTypeParamValue` that is *not* allowed by other rules:

xTypeParamValue[6] ≡
    `'*'` This macro is invoked in definition 3.

2.4 Equivalence Entity

Equivalence Entity[7] ≡
    `xVariable` This macro is invoked in definition 2.

2.5 Letter Specifications

Letter Specifications[8] ≡
    `xImpl` This macro is invoked in definition 2.

2.6 Scalar Integer Literal Constant

Scalar Integer Literal Constant[9] ≡
    `xIcon` This macro is invoked in definition 2.

2.7 Constant Expression

Constant Expression[10] ≡
    `xExpr` This macro is invoked in definition 2.

2.8 Integer Expression

Integer Expression[11] ≡
    `xExpr` This macro is invoked in definition 2.

2.9 Int-Real-Dp Expression

Int-Real-Dp Expression[12] ≡
`xExpr`This macro is invoked in definition 2.

2.10 Scalar Logical Expression

Scalar Logical Expression[13] ≡
`xExpr`This macro is invoked in definition 2.

2.11 Assignment Statement

Assignment Statement[14] ≡

```
xAssignmentStmt:
  xLblDef xName '=' xExpr xEOS /
  xLblDef xName '(' xSFExprList ')' '=' xExpr xEOS /
  xLblDef xName '(' xSFExprList ')' xSubstringRange '=' xExpr xEOS .

xSFExprList:
  ':' /
  ':' xExpr /
  xSFExpr /
  xSFExpr ':' /
  xSFExpr ':' xExpr /
  xSFExprList ',' xSectionSubscript /
  xSFDummyArgNameList ',' ':' /
  xSFDummyArgNameList ',' ':' xExpr /
  xSFDummyArgNameList ',' xSFExpr /
  xSFDummyArgNameList ',' xSFExpr ':' /
  xSFDummyArgNameList ',' xSFExpr ':' xExpr .
xSFExpr: xSFTerm / xSign xAddOperand / xSFExpr xAddOp xAddOperand .
xSFTerm: xSFFactor / xSFTerm xMultOp xMultOperand .
xSFFactor: xSFPrimary / xSFPrimary xPowerOp xMultOperand .
xSFPrimary:
  xIcon /
  xSFVarName /
  xComplexDataRef /
  xFunctionReference /
  '(' xExpr ')' .
```

```
xAssignStmt:
  xLblDef 'assign' xLblRef 'to' xVariableName xEOS .
```

This macro is invoked in definition 2.

3 Semantically-Equivalent Grammar Symbols

Many of the symbols used in the context-free grammar represent semantically-equivalent phrases. Some are used to make the prose of the standard clearer, others avoid ambiguities. There is no reason to distinguish them once the abstract syntax tree is built, and so we replace all of the symbols in an equivalence class by a single member of that class.

3.1 Equivalence Classes Common to FORTRAN 77 and FORTRAN 90

Equivalence Classes Common to FORTRAN 77 and FORTRAN 90[15] ≡

```
xProgramUnit ::=
       xMainProgram xSubroutineSubprogram xFunctionSubprogram
       xBlockDataSubprogram.

xSubprogramRange ::=
       xFunctionRange xSubroutineRange .

xComblock ::=
       xSavedCommonBlock .

xFormalParameter ::=
       xFunctionPar xSubroutinePar.

xFormatIdentifier ::=
       xRdFmtId.

xFormalParameterList ::=
       xFunctionParList xFunctionPars xSubroutineParList xSubroutinePars.

xBody ::=
       xConditionalBody xBlockDataBody .

xBodyConstruct ::=
```

```
        xSpecificationPartConstruct xDeclarationConstruct
        xExecutionPartConstruct xExecutableConstruct
        xBlockDataBodyConstruct .

xLoopControl ::=
        xCommaLoopControl.

xCharSelector ::=
        xLengthSelector.

xArg ::=
        xSubroutineArg .

xArgList ::=
        xSubroutineArgList .

xExpr ::=
        xPrimary xLevel1Expr xLevel2Expr xLevel3Expr xLevel4Expr xLevel5Expr
        xFunctionReference
        xAddOperand xMultOperand xEquivOperand xOrOperand xAndOperand
        xSFPrimary xSFTerm xSFFactor xSFExpr
        xUFPrimary xUFExpr xUFTerm xUFFactor
        xCPrimary xCExpr xCOperand
        xRdFmtIdExpr xCommaExp .

xExprList ::=
        xSFExprList .

xStmt ::=
        xSpecificationStmt xActionStmt
        xImplicitStmt
        xIfThenStmt xElseIfStmt xElseStmt
        xParameterStmt xFormatStmt xEntryStmt xTypeDeclarationStmt
        xCommonStmt xDataStmt xDimensionStmt
        xEquivalenceStmt xExternalStmt xIntrinsicStmt xSaveStmt
        xArithmeticIfStmt
        xAssignmentStmt xAssignStmt xBackspaceStmt xCallStmt xCloseStmt
        xContinueStmt xEndfileStmt xGotoStmt xComputedGotoStmt
        xAssignedGotoStmt xIfStmt xInquireStmt xOpenStmt xPauseStmt
        xPrintStmt xReadStmt xReturnStmt xRewindStmt xStmtFunctionStmt
        xStopStmt xWriteStmt xLabelDoStmt .

xBinOp ::=
        xConcatOp xPowerOp xMultOp xAddOp xRelOp xAndOp xOrOp xEquivOp.
```

```
xUnOp ::=
       xNotOp xSign .

xVariableName ::=
       xVariableComma .

xIoControlSpec ::=
       xCloseSpec xRdCtlSpec xConnectSpec xInquireSpec xPositionSpec .

xIoControlSpecList ::=
       xCloseSpecList xRdIoCtlSpecList xPositionSpecList xConnectSpecList
       xInquireSpecList .

xArraySpec ::=
       xExplicitShapeSpecList xAssumedSizeSpec.

xDataStmtObject ::=
       xDataIDoObject.

xOutputItemList ::=
       xOutputItemList1 .

xFmtSpec ::=
       xFormatedit xFormatsep xEditElement.
```

This macro is invoked in definition 21.

3.2 Equivalence Classes Specific to FORTRAN 90

Equivalence Classes Specific to FORTRAN 90[16] ≡

```
xProgramUnit ::=
       xModule xModuleSubprogram .

xHeader ::=
  xModuleStmt
  .

xBody ::=
       xBlockDoConstruct xModuleBody xSubprogramInterfaceBody
       xInterfaceBody xInterfaceBlockBody xCaseConstruct
```

```
        xSelectCaseBody xWhere xWhereConstruct xElseWhere
        xBodyPlusInternals .

    xLine ::=
      xEndModuleStmt
      .

    xSubprogramRange ::=
      xFunctionInterfaceRange xSubroutineInterfaceRange .

    xArg ::=
        xFunctionArg .

    xArgList ::=
        xFunctionArgList .

    xExpr ::=
        xArrayConstructor xTarget xMaskExpr .

    xPointerObject ::=
        xPointerField.

    xAcValueList ::=
        xAcValueList1.

    xStmt ::=
        xUseStmt
        xDerivedTypeDef xModuleSubprogramPartConstruct xContainsStmt
        xAccessStmt xAllocatableStmt
        xIntentStmt xNamelistStmt xOptionalStmt xPointerStmt xTargetStmt
        xEndDoStmt
        xAllocateStmt xCycleStmt xDeallocateStmt xExitStmt
        xNullifyStmt xPointerAssignmentStmt
        xWhereStmt xElsewhereStmt xWhereConstructStmt
        xCaseStmt xCaseBodyConstruct
        xDerivedTypeBodyConstruct
        xPrivateSequenceStmt xComponentDefStmt
        xInterfaceBodyPartConstruct xModuleProcedureStmt.

    xArraySpec ::=
        xComponentArraySpec xExplicitShapeSpecList xDeferredShapeSpecList
        xAssumedShapeSpecList xAssumedSizeSpec.
```

This macro is invoked in definition 21.

4 Literal Terminals Recognized by special means

Under normal circumstances, Eli uses a finite-state machine to recognize all of the literal terminal symbols of a context-free grammar. FORTRAN keywords and operators like `.EQ.`, however, are recognized specially by the scanner. Thus they must *not* be included in the finite-state machine.

We prevent them from being included by providing a specification to recognize their appearance in the grammar. This specification is written using GLA regular expressions:

Literal Terminals Recognized by special means[17] ≡

```
Keyword:        $[a-zA-Z][a-zA-Z]*=?
xDefop: $\.[a-zA-Z]*\.
```

This macro is invoked in definition 20.

`Keyword` recognizes keywords, including I/O controls followed by `=`; `xDefop` recognizes operators delimited by dots.

The specification is output as a file not belonging directly to the specification set, but information is derived from it:

Derivation of a terminal symbol extractor[18] ≡

```
grammar.gla :kwd
```

This macro is invoked in definition 22.

5 Output files

5.1 grammar.con

A type-`con` file contains the context-free grammar describing the way a program is written.

grammar.con[19] ≡

```
xSourceFile : xExecutableProgram.

```

Productions Common to FORTRAN 77 and FORTRAN 90[2]
`#if !`*Fortran77*[1]
Productions Specific to FORTRAN 90[3]
`#endif`

This macro is attached to a product file.

5.2 grammar.gla

A type-`gla` file contains regular expressions defining a set of strings. The `@N` operation marks this file as a "non-product file"; a file that is used in the derivation of product components, but is not itself a component of the product.

grammar.gla[20] ≡

Literal Terminals Recognized by special means[17]

This macro is attached to a non-product file.

5.3 grammar.map

A type-`map` file contains the equivalence classes for the abstract syntax.

grammar.map[21] ≡

```
MAPSYM
Equivalence Classes Common to FORTRAN 77 and FORTRAN 90[15]
#if !Fortran77[1]
Equivalence Classes Specific to FORTRAN 90[16]
#endif
```

This macro is attached to a product file.

5.4 grammar.specs

A type-`specs` file contains derivations for components of the product.

grammar.specs[22] ≡

Derivation of a terminal symbol extractor[18]

This macro is attached to a product file.
